EDUCATION

University of California – San Diego

B.S in Computer Science, Minor in Business Economics | GPA: 3.86

Expected Completion: December 2027

SKILLS

Languages: Java, Python, JavaScript, C, HTML, CSS, Groovy

Frameworks/Libraries: NumPy, Pandas, React, Node.js, MERN Stack, PyTorch, Scikit-learn, Django

Tools & Platforms: GitHub, VS Code, RESTful APIs, Firebase, MongoDB, Postman, LLM APIs, Linux, Agile, Docker, Triton, MATLAB

WORK EXPERIENCE

UC San Diego IT Service

February 2026 - June 2026 (Returning September 2026)

Software Engineer

- Support backend infrastructure for distributed machine learning workloads and DSMLP Kubernetes clusters, troubleshooting production issues affecting containerized workloads and Jupyter Notebook environments using **Docker** and **Kubernetes**.
- Refactor and migrate **15+ Grouper identity and access management templates** from Groovy to Java, building unit-testable backend services with **JUnit**, integrating **SQL/PostgreSQL** queries to improve maintainability, test coverage, and reliability.
- Develop backend APIs using **Java, Gradle, and Flyway**, implementing performance logging, automated testing pipelines, and CI/CD workflows to diagnose latency issues and improve production service health.

LaNova AI

June 2026 – Current

Software Engineer Intern

- Developed an AI-assisted outreach platform in **Python** that used **Gemini and RAG** to retrieve consultant profiles from CRM data and web search, generating personalized, human-reviewed outreach for **160+ high-priority NAICC consultants**.
- Engineered retrieval and classification pipelines by integrating **REST APIs and semantic search** with structured CRM data, automating outreach management and supporting go-to-market campaigns targeting **80+ Tier-1 industry leaders**.

Runway Avenue

September 2025 – December 2025

Software Engineer Intern

- Designed and developed backend infrastructure for deploying AI models as self-contained packages using Docker and NVIDIA Triton Inference Server to enable scalable and efficient model inference.
 - Implemented Go (Golang) services to manage inference requests, expose model APIs, and integrate with external systems.
-

RESEARCH & LEADERSHIP EXPERIENCE

UCSD Scripps Research Lab

August 2025 - Current

Undergraduate Research Assistant

- Developed and evaluated machine learning pipelines in **PyTorch** and **scikit-learn**, comparing Random Forest and ImageNet-pretrained ResNet architectures through systematic experiments on fine-tuning depth, dropout regularization, class-weighted loss, and confidence-threshold optimization to improve multiclass classification performance.
- Processed and analyzed **70K+** marine microscopy images using **Python** and **MATLAB**, performing feature engineering, dimensionality reduction, and class imbalance mitigation through augmentation, achieving **92% classification accuracy** while reducing manual annotation effort by **80%**; currently co-authoring a research paper on the methodology and results.

Computer Science Engineering Society UCSD

December 2024 - Current

President 2026-27, Director of Logistics 2025-26

- Lead a **160+** member CS organization, directing operations, sponsorships, budgeting, and cross-functional initiatives while coordinating technical. Co-direct SanD Hackathon, CSES's 25-hour hackathon, overseeing planning and execution for **200+** participants, coordinating logistics across multiple teams, and securing **6+** industry sponsors, including Cisco and Lovable.
-

AWARDS & PROJECTS

Berkeley AI Hackathon

June 2025

Employ AI

- Built a full-stack AI application using a Python/Flask backend, Firebase, and responsive HTML/CSS frontend, implementing a RAG pipeline and integrating Groq APIs to optimize inference across Llama, Gemini, and Whisper models for AI-assisted job application generation; awarded the Groq Sponsorship Award for Best Technical Implementation among 300+ hackathon teams.

Cal Hacks

October 2025

OnWise

- Built a cross-platform mobile app with **React Native** and **JavaScript** to help elderly users detect misinformation and AI-generated content; implemented a multi-tab UI mimicking major social platforms using modular React components and JSON data.
- Integrated a speech-to-speech AI pipeline leveraging **LiveKit**, **WebSockets**, and **OpenAI GPT-4** for real-time, context-aware voice interaction between users and the AI agent.
